

New Compensating Clutch for Live Tooling DOOSAN Machines

*"Another engineered
innovation from
Eppinger's unique
design Compensation
Clutch."*

- This clutch is twice as big as the old coupling/clutch therefore the torque transfer is greater due to more surface area.
- The clutch compensates for misalignment between the turret drive motor and the tool holder therefore resulting in less wear on the drive motor and tool holder.
- Better alignment which results in better finishes AND longer tool life
